DEVICE TEST

1, Explain behaviour of hub device

Its used to connect multiple devices and its used to broadcast only. Its called as Layer 1. Data sending from one device to another device while data collision is happening because hub is half duplex. Data sending and receiving simultaneously.

2, Explain behaviour of switch device

This is intelligent device. Data sending from A (port1) device to B (port2) via switch. Here one table is available, one is Port and another is MAC table. So here is storing the port and mac details on this table. Its called address learning. Switch sending broad cast to B & C Devices. Here C (port3) cant open the data . Now B Device sending reply request to Switch . Here details storing on MAC table. Then Switch check the DMAC on the Mac table . Its already available, so data sending to A device through port 1

3, Explain behaviour of router device

Its used to break broad cast domain. Its unicast services only. Maintaining Routing table. Its known as Directly connected Router. Routing table contains Network ID, Prefix and Interface name.
